#### **Robots in Human Spaces**

#### Ten years ago human-friendly robots were still a vision only

#### Industry & SMEs

Micro enterprises

Medicine

Assistive care

**Elderly Care** 

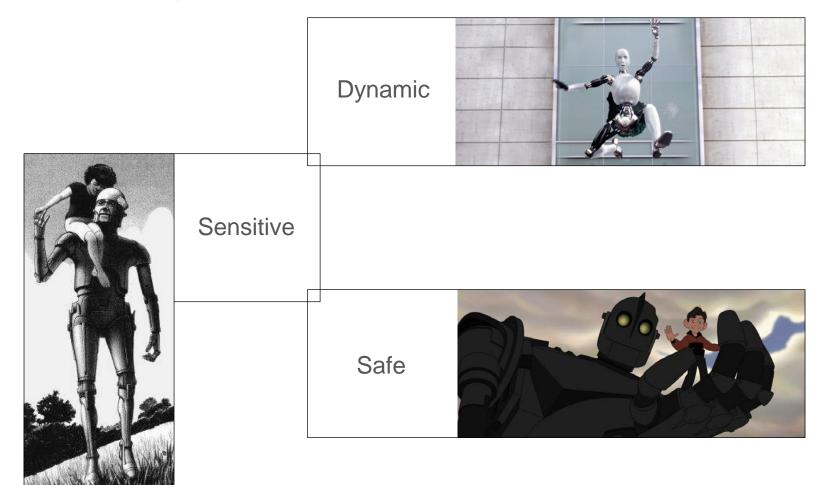

Service robotics

Lifestyle & Games

#### **The Optimal Robot**

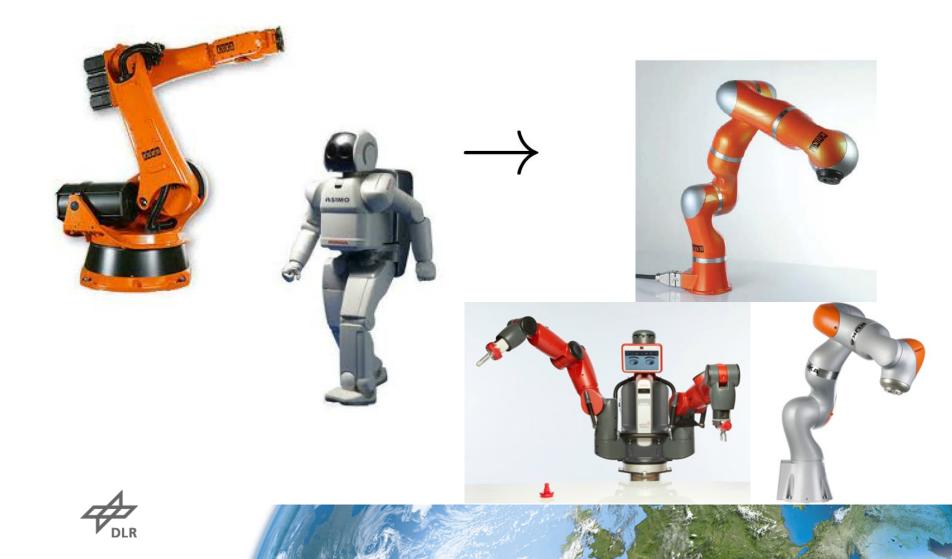

#### **Concept Study "Co-Worker"**

DLR

#### **Paradigm Shift: New Generation of Robots**

#### This also led to a paradigm shift in control

Classical view:

- Position based tracking
  - Motion planning  $\rightarrow$  interpolation  $\rightarrow$  trajectory tracking law  $\rightarrow$  motor control

Now:

- Tracking (still the fall back baseline)
- Soft robotics
  - Interaction control (force control, impedance control,...)
  - Reflex control (collision detection & reaction patterns)
  - Task + kinematic constraints
  - Multi-priority control
  - ...

Significant increase in complexity Planning needs to consider physical contact,... and thus takes probably an entirely different form

#### Interaction control

#### **Cartesian Impedance Control**

# $M_{x,d}\ddot{\tilde{\mathbf{x}}} + D_{x,d}\dot{\tilde{\mathbf{x}}} + K_{x,d}\tilde{\mathbf{x}} = \mathcal{F}_{\mathrm{ext}}$

#### **Cartesian impedance control & nullspace behavior**

#### **Impedance control**

DLR

#### **Torque control with gravity compensation**

#### **Robust Grasping**

# strategies for misaligned grasping

#### **Adaptive Impedance Control**

Adaptive Controller:

$$\boldsymbol{\tau}_d(t) = \boldsymbol{\tau}_{ff} - K(t)\mathbf{e}(t) - D(t)\dot{\mathbf{e}}(t) - L(t)\boldsymbol{\epsilon}(t) + \boldsymbol{\tau}_r(t)$$

$$\boldsymbol{\epsilon} = \dot{\mathbf{e}}(t) + \kappa \mathbf{e}(t).$$

Human: minimization of metabolic cost and motion error

Impedance and feed-forward torque adaptation law:

$$\begin{aligned} \delta \boldsymbol{\tau}_{ff}(t) &= Q_{\tau}(\boldsymbol{\epsilon}(t) - \gamma(t)\boldsymbol{\tau}_{ff}) \\ \delta K(t) &= Q_{K}(\boldsymbol{\epsilon}(t)\mathbf{e}^{T}(t) - \gamma(t)K(t)) \\ \delta D(t) &= Q_{D}(\boldsymbol{\epsilon}(t)\dot{\mathbf{e}}^{T}(t) - \gamma(t)D(t)) \end{aligned}$$

### Collision detection & reflex reaction

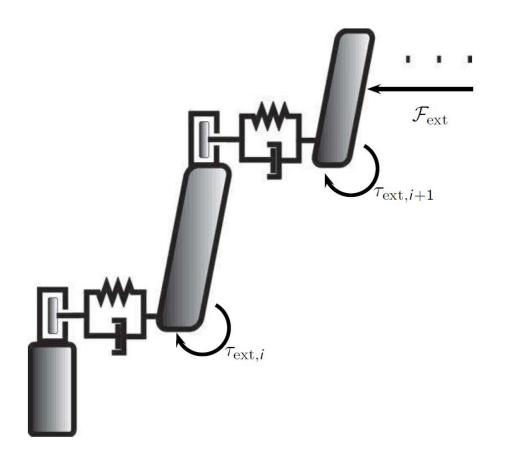

#### **Flexible Robots**

#### **Flexible Robots**

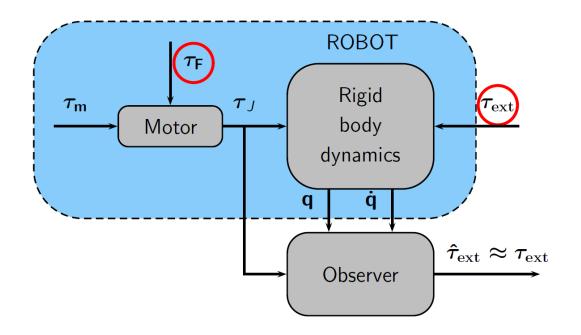

#### **Collision Detection and Estimation**

Flexible Joint Dynamics:

$$M(\mathbf{q})\ddot{\mathbf{q}} + C(\mathbf{q}, \dot{\mathbf{q}})\dot{\mathbf{q}} + \mathbf{g}(\mathbf{q}) = \boldsymbol{\tau}_J + \boldsymbol{\tau}_{\text{ext}}$$
$$B\ddot{\boldsymbol{\theta}} + \boldsymbol{\tau}_J = \boldsymbol{\tau}_m$$

#### **Observer Design**

## Idea: Observe generalized momentum

 $\mathbf{p} = M(\mathbf{q})\dot{\mathbf{q}}$ 

Reformulated dynamics:

$$\dot{\mathbf{p}} = \boldsymbol{\tau}_J - eta(\mathbf{q}, \dot{\mathbf{q}}) - \boldsymbol{ au}_{\mathrm{ext}}$$

Residual model:

$$\hat{\mathbf{r}} = \hat{\boldsymbol{\tau}}_{\mathrm{ext}}$$
  $\hat{\dot{\mathbf{r}}} = \mathbf{0}$ 

Observer design:

$$\hat{\dot{\mathbf{r}}} = K_O\left(\int_0^T \left[\boldsymbol{\tau}_J - \boldsymbol{\beta}(\mathbf{q}, \dot{\mathbf{q}}) - \hat{\mathbf{r}}\right] \mathrm{d}t - M(\mathbf{q})\dot{\mathbf{q}}\right)$$

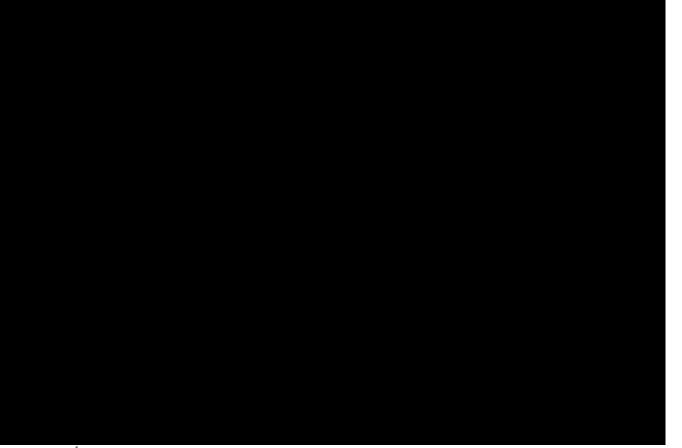

#### **Decoupled Estimation of External Torques**

$$\hat{r}^{i} = \frac{1}{sT_{O}^{i} + 1} \tau_{\text{ext}}^{i} = \frac{K_{O}^{i}}{s + K_{O}^{i}} \tau_{\text{ext}}^{i} \approx \tau_{\text{ext}}^{i} \quad \forall i \in \{1, ..., n\}$$

## Real-time motion planning and collision avoidance

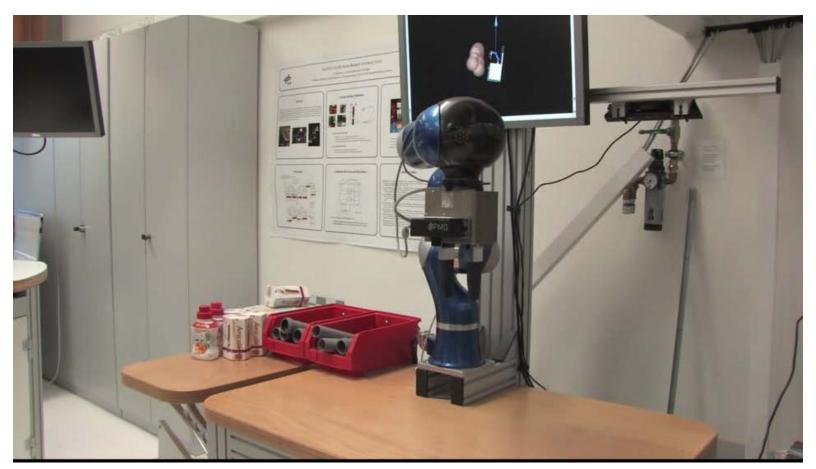

#### **Real-Time Planning**

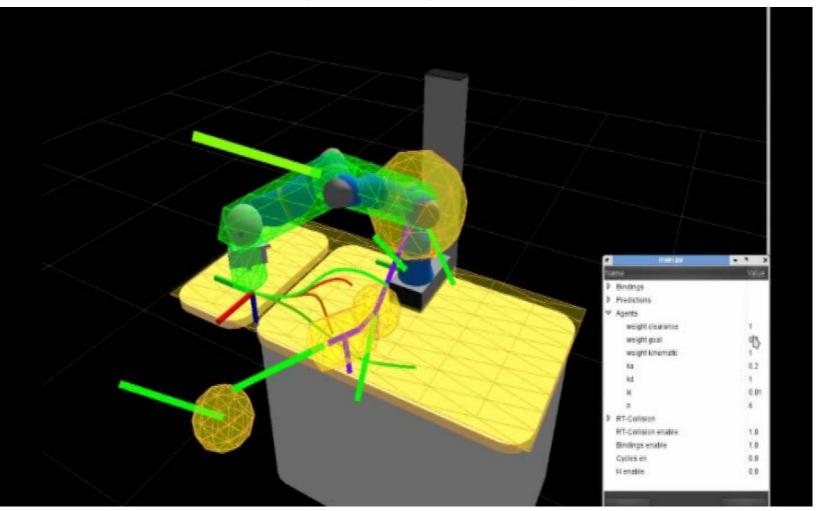

#### **Collision Avoidance**

DLR

#### **Cost Based Multi-Agents + Dynamical Systems**

#### What I omitted

- Various types of trajectory generation schemes
- Force profiles
- Virtual walls
- Self-collision avoidance
- Visual servo control
- Complex reflexes
- Emergency patterns

Extremely large set of associated methods & algorithms with according constraints that might be

- hard,
- not so hard,
- fuzzy,

• • •

• I have no idea what exactly the constraint actually is,

#### **General observations**

Experience from **real-world** problems:

- automatic planning cannot solve most real-world problems due to lacking expert knowledge (where should that come from anyway), limitations in modeling, simulation of the real-world + curse of dimensionality
- FDI is doable, but fault reaction is really hard for non-trivial problems
- Related question: Where do the constraints come from? Also mostly coming from human expertise
- Basically:
  - Expert skills that encapsulate a task invariant, however, parameterizable logical structure including constraints (explicite and/or implicit)
  - Repertoire of skills on which one might plan or program again
- Need: Programming of expert nodes (substitute your favorite synonym here) + planning on top of this
- Automatic planning problem would be significantly simplified

## Programming models

#### Requirements

Representation needed for encapsulating Soft-robots' behaviors and actions

Atomic A	Action	
	Command	
	Behavior	

#### Rough guess:

- 12 M + 12\*200 PM
- 10 C + 200PC
- Reflex depth: 10
- Safety set:10 different reflexes

#### DEFINITION Behavior:

#### 6-tuple

$$\mathbf{b} = (m, p_m, c, p_c, pr, s) \in \mathcal{B} = (M \times P_M \times C \times P_C \times PR \times S)$$

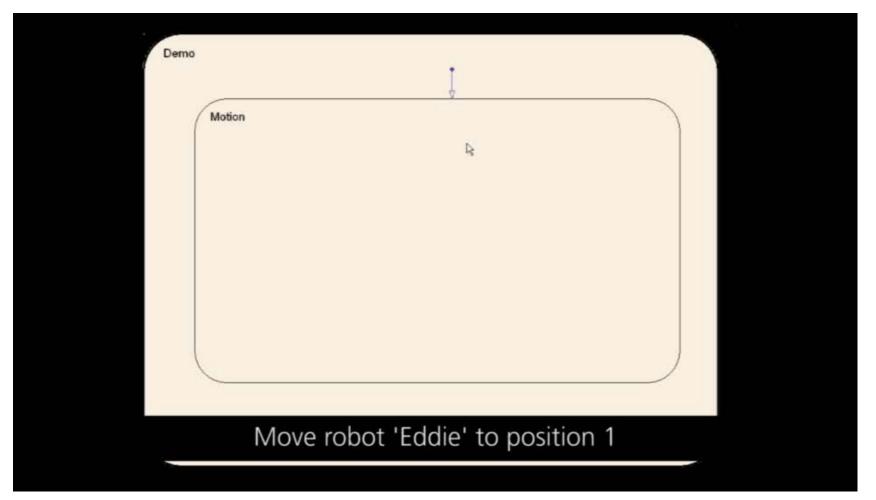

#### DEFINITION

#### Sets:

- *M* a set of trajectory generation (motion) modes with *P<sub>M</sub>* as its respective parameter set
- *C* denotes a set of control modes with *P<sub>C</sub>* as its respective parameter set
- *PR* a set of priorities
- S a set of safety configurations

#### **Programming Interaction**

#### **Task and Interaction Planning: Store**

#### together with UniBremen + TUM

#### **Task and Interaction Planning: Retrieve**

#### together with UniBremen + TUM

www.DLR.de • Chart 49 Sami Haddadin • 6 July, 2013

#### Last but not least: Intrinsically elastic robots

#### **Newest Robot Generation**

#### rigid and heavy

#### passively compliant & light

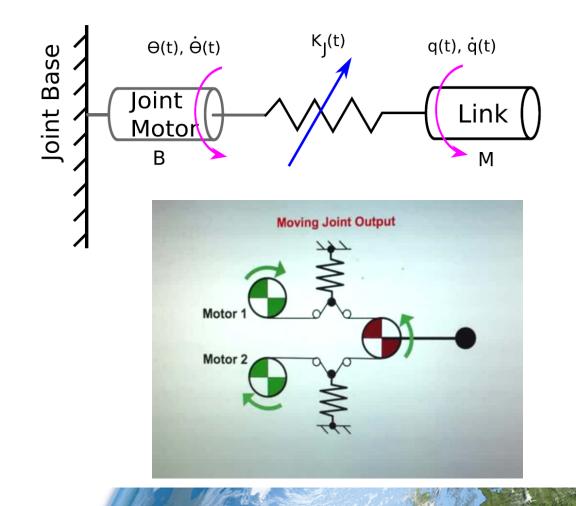

#### actively compliant & light

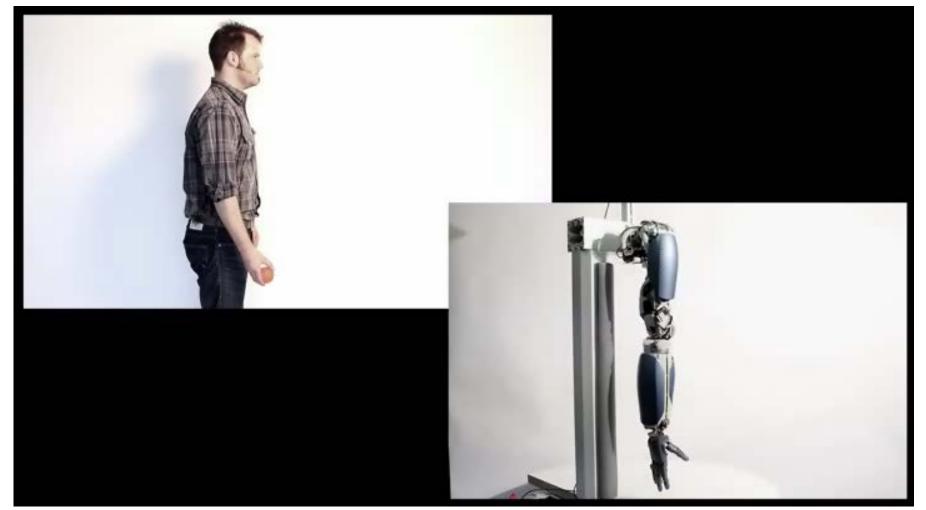

#### **Elastic Robot Design**

#### **Energy storage in elastic joints**

#### **Intrinsic Elasticity: The Key to Human Like Performance**

#### **Problems**

Entirely new control problems

- Tracking is only one of many motion problems
- Soft-robotics + new world of problems
- How to combine control, learning, generalization?
- This makes the aforementioned complexity even larger!
